

# Getting Started with GitHub

With  
Sushree Satarupa

# Welcome! My name is Sushree Satarupa

1

I'm here to lead this session & help you learn something new today!

2

I'm a CSE pre final year student at NIT Rourkela.

3

I'm the founder of SHECODERS and one of the MLSAs

# What will you **learn** today?

- 1 The basics of GitHub
- 2 The GitHub Workflow

# How Will You Build It?

1. Make an account on GitHub.
2. Fork the repo that I created.
3. Add a txt file naming it with your roll number and add some details about yourself inside the file.
4. And make a pull request.
5. The workshop organizer will approve and merge pull requests.
6. Refresh the main repository to see people's files being added!

**Now that you understand how it works,  
let's get started!**

# Table of Contents

- 1. Introduction to Git and GitHub
- 2. GitHub Collaboration WorkFlow

**We're all going to collaborate on a project together.**

**How?**

**Version control!**

# Git vs. GitHub

What's the difference?

## Git

- Git is a version control system.
- It can be used with various tools or locally on your computer to help you keep track of changes in your code projects.
- Think of it like Google Docs for code, but better.

## GitHub

- GitHub is a platform for code collaboration!
- GitHub uses Git for version control and provides you all sorts of awesome collaboration tools.

# GitHub

# Why version control?

Because emailing a file around is painful

## Version control features:

- Log changes in a searchable way, instead of renaming a file for each version.

- Collaborators can work in parallel and merge their changes automatically, instead of manually comparing the differences between a file

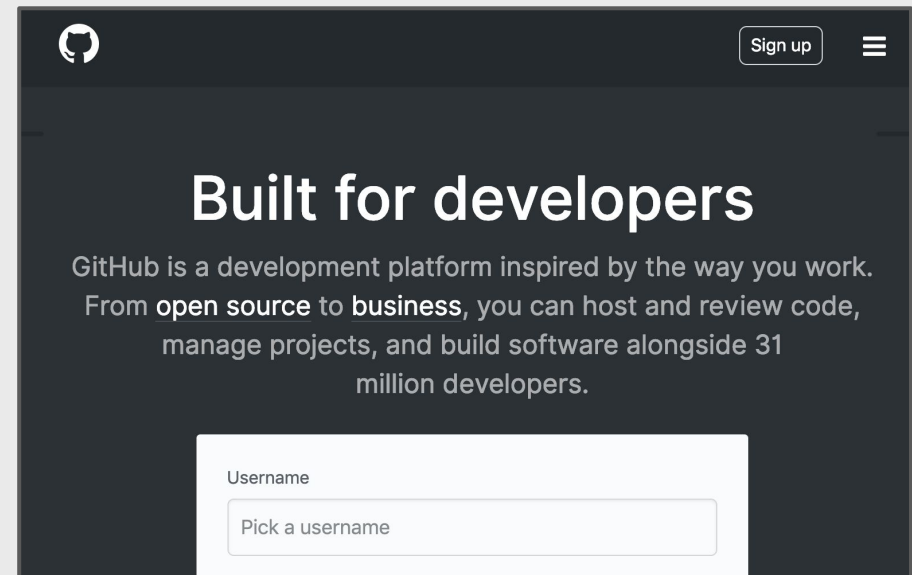

# Let's make an account!

Visit the URL on the left if you're a student and on the right if you are not. Follow the instructions on GitHub.com to make your account!

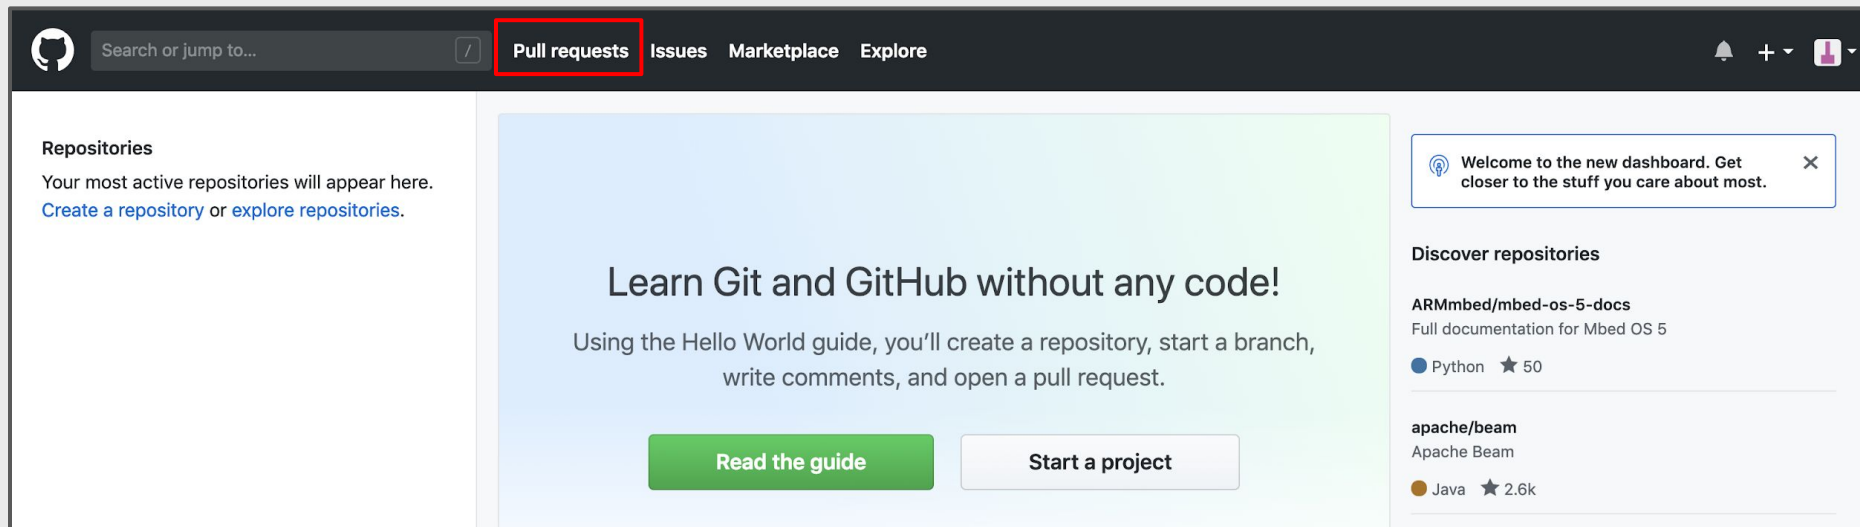

<http://mlhlocal.host/github-edu>

<http://mlhlocal.host/github-signup>

# Explore GitHub

The GitHub platform provides numerous features for collaboration.

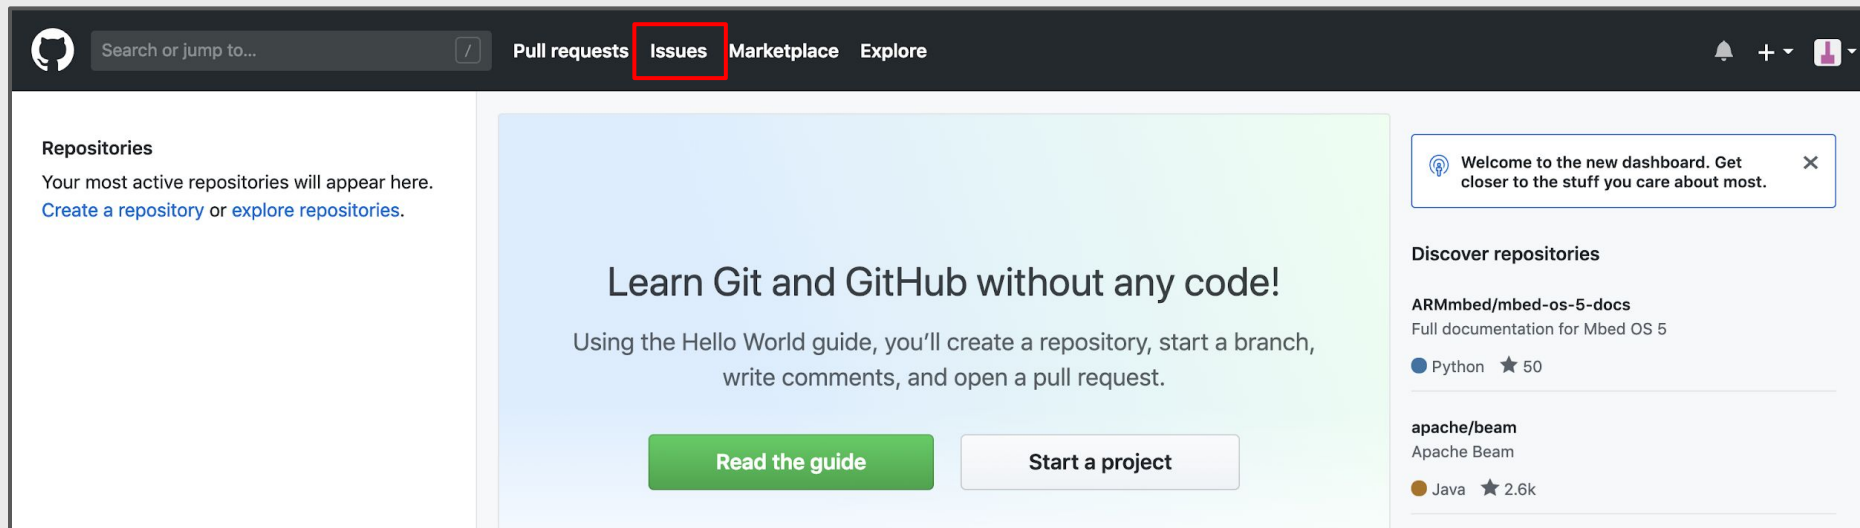

Next to the search bar, you can select Pull requests. This will show you your own pull requests against other people's repos.

## Key Term

**pull request**: a way to ask to make changes to someone else's code by submitting your own changes for their review

# Explore GitHub

The GitHub platform provides numerous features for collaboration.

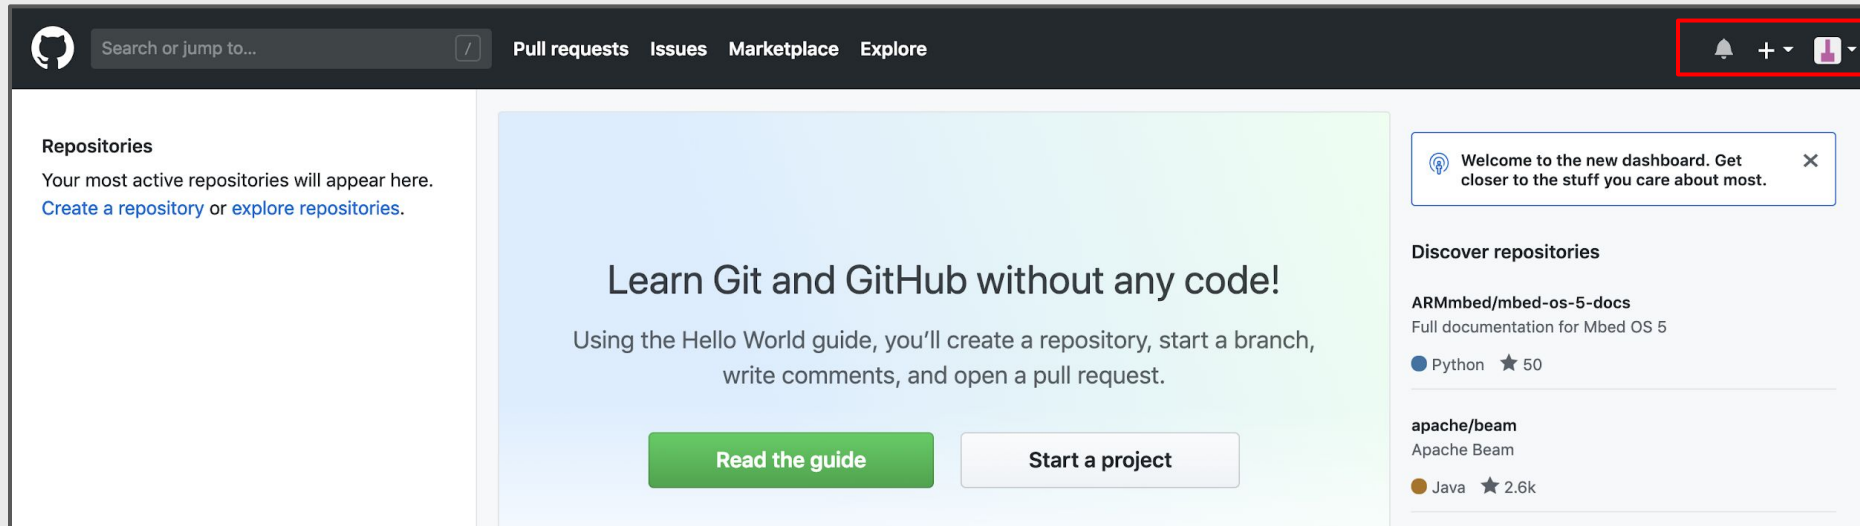

Next to pull requests, you can see any issues you've opened or worked on.

## Key Term

**issues:** a way to share a problem about someone else's code, without necessarily submitting your own solution

# Explore GitHub

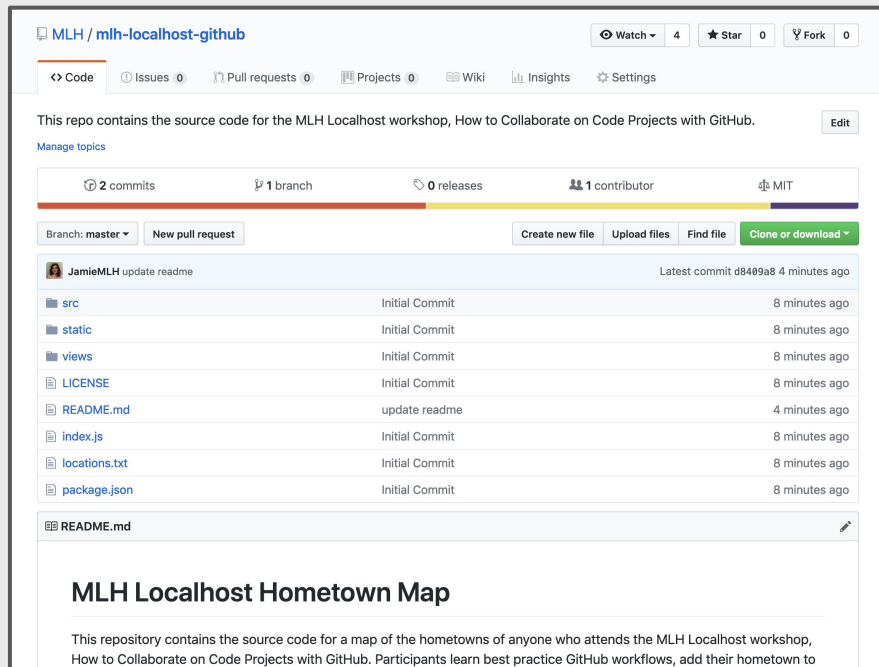

The GitHub platform provides numerous features for collaboration.

- In the upper right hand corner, you can see any notifications you have received.
- The + symbol allows you to create a new project.
- Clicking your avatar opens the settings menu.

# Explore a Repository

Navigate to the URL below and let's check out the repository for the map!

<http://mlhlocal.host/github-code>

## Key Term

**repository**: think of this like a project folder where code is stored!

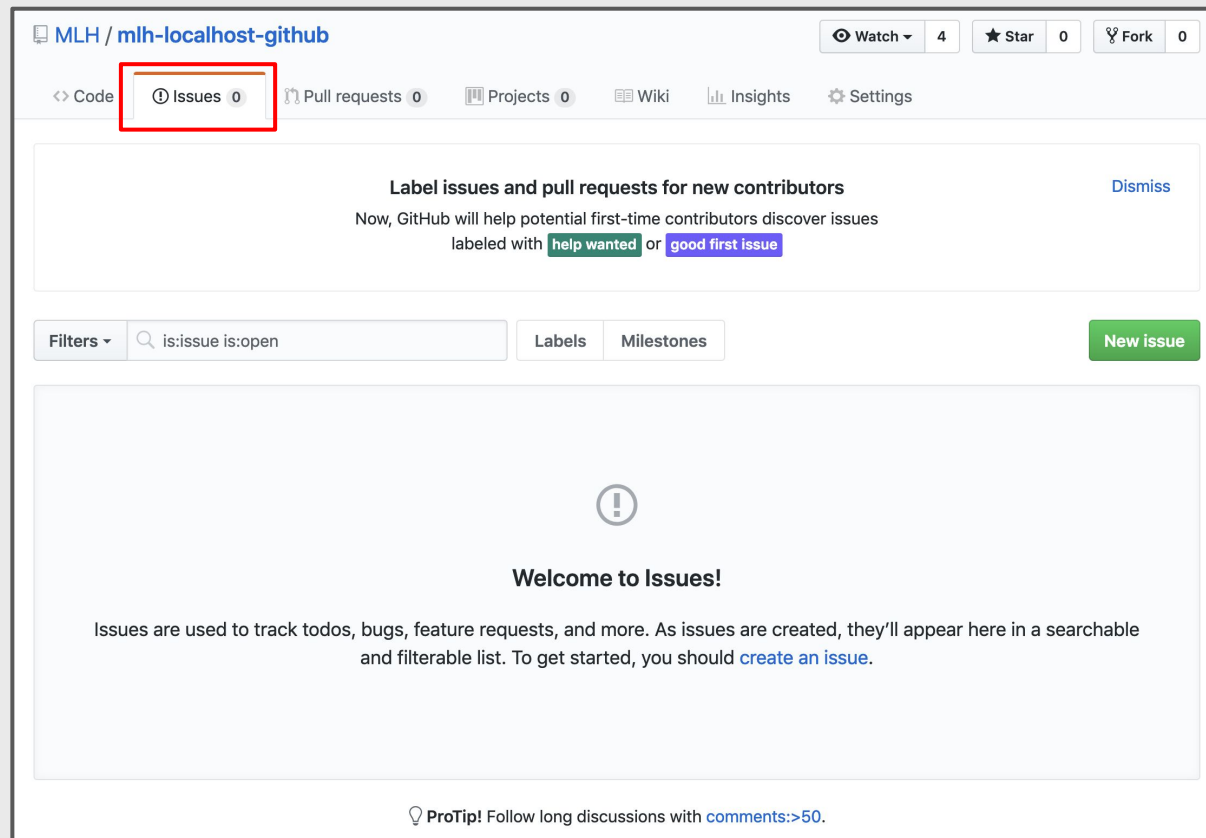

# Explore a Repository

The first tab in a repository is the **Code** tab. It shows the code in the project.

The screenshot shows the GitHub repository page for **MLH / mlh-localhost-github**. The **<> Code** tab is highlighted with a red box. The repository description states: "This repo contains the source code for the MLH Localhost workshop, How to Collaborate on Code Projects with GitHub." The repository statistics show 2 commits, 1 branch, 0 releases, 1 contributor, and the MIT license. The file list includes `src`, `static`, `views`, `LICENSE`, `README.md`, `index.js`, `locations.txt`, and `package.json`. The `README.md` file is selected, showing the title **MLH Localhost Hometown Map** and the description: "This repository contains the source code for a map of the hometowns of anyone who attends the MLH Localhost workshop, How to Collaborate on Code Projects with GitHub. Participants learn best practice GitHub workflows, add their hometown to

# Explore a Repository

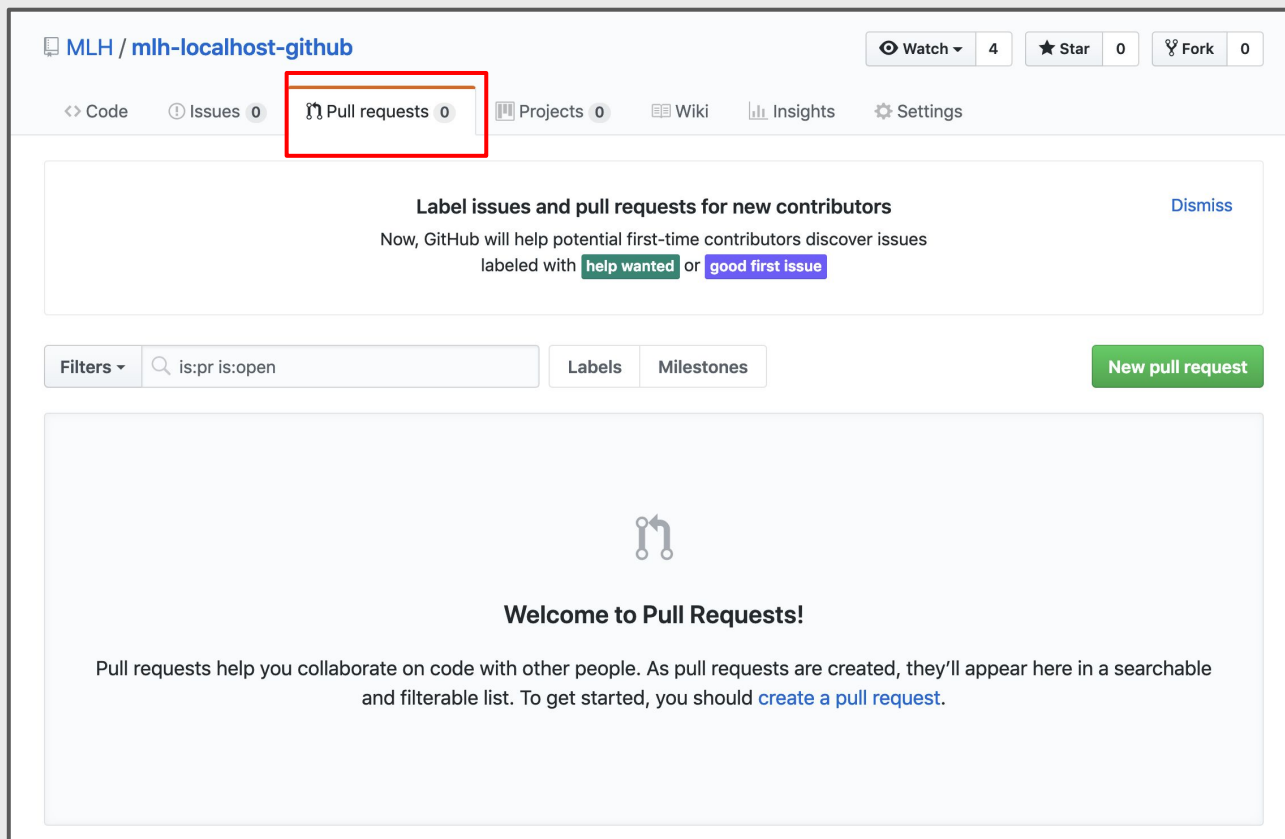

The second tab is the **Issues** tab. If there is a problem with the code in someone's project, you can open an Issue and let them know about it. Pro-tip: You should always follow the project maintainer's instructions for opening an issue.

# Explore a Repository

The third tab is the **Pull Requests** tab. If you want to contribute code to someone's repository, you'll open a Pull Request. You'll do that today!

**There is a lot of terminology regarding  
Git and GitHub. Let's get started!**

# Table of Contents

1. Introduction to Git and GitHub

 2. GitHub Collaboration WorkFlow

# Developer Workflow

You're going to practice a typical best practice developer workflow.

First, you'll **fork** someone else's code. This means creating your own copy of it.

## Key Terms

**fork**: your own copy of someone else's repository.

# Developer Workflow

1. When you're happy with changes, you'll **commit** them.
2. If you want to add your code to someone else's project, you'll open a **pull request**.
3. If they approve it, they'll **merge** your branch into their master branch.

## Key Terms

**commit**: a group of revisions you want to officially add to your branch

**merge**: to officially add the changes from your branch into the master branch (or another branch)

**Great! That's it. That's how you work with  
Git. Let's try it using GitHub!**

**Amazing! Now you know how to work with  
GitHub in the browser.**

# GitHub

*Let's recap quickly...*

- 1 Git is a version control system allowing multiple people to collaborate
- 2 GitHub adds features to Git and provides a web interface
